

# HAIR RESTORATION

## How is hair restored?

We stimulate the hair follicles through the process of injecting Platelet Rich Plasma (PRP) into the desired areas. During your consultation, we do an evaluation to see if you are a good candidate for this procedure. When you come in for your PRP hair restoration treatment, we will start by drawing your blood and spin the vials in a centrifuge, which separates the red blood cells and the PRP. Then we prep the area with a numbing agent to provide comfort. We then inject it into the areas on the scalp where hair growth is desired. Once injected, the PRP releases growth factors, which stimulate new follicles and increase blood flow.

## How long does the procedure take?

PRP hair restoration appointments are usually about 30 minutes. Most of the appointment is spent prepping the patient with the numbing agent and preparing the PRP. Once we start injecting, the procedure goes pretty quickly. One of the great things about this treatment is that there is really no downtime. Patients will often come in on their lunch break and return to work or their daily activities after their treatment.

## Does the procedure hurt?

We provide the patient comfort by numbing the area before starting the treatment. Discomfort level varies from patient to patient. This treatment has been well tolerated by our patients.

## How many treatments to see results?

Although hair growth is stimulated after the first treatment, noticeable results begin to show after 3 - 4 treatments. We recommend starting with at least 6 treatments every 30 days. Treatment plans are customized based on patient needs. Packages are available.

PRP for hair restoration is a safe and natural treatment. It's efficacy has been demonstrated in many clinical trials over the past several years. We have seen excellent results with patients here in our office!
